# NovaSure® Endometrial Ablation

A quick, one-time in-office procedure for heavy menstrual bleeding — no hormones required

## 📊 HEAVY PERIODS — BY THE NUMBERS

| 1 in 3 | 80% | 5 min |
|---|---|---|
| Women seek treatment for heavy menstrual bleeding | Find periods disruptive to physical & emotional well-being | Average procedure time for NovaSure ablation |

Heavy menstrual bleeding (HMB) affects millions of women and can interfere with work, social life, relationships, and sleep. If you soak through pads or tampons every hour or more, or if bleeding lasts more than 7 days, you may be a candidate for NovaSure.

## 🔬 HOW NOVASURE WORKS

1. **Cervix dilation:** The cervix is gently dilated. No incisions are needed.
2. **Device placement:** A slender wand is inserted through the cervix, extending a triangular-shaped mesh into the uterine cavity.
3. **Safety check:** The device checks uterine dimensions and integrity before activating.
4. **Ablation:** Precisely controlled radiofrequency energy is delivered for approximately **90 seconds**, destroying the uterine lining.
5. **Removal:** Device is removed. Total procedure time: approximately **5 minutes**.

## ✅ BENEFITS & RESULTS

**✅ What to Expect After NovaSure:**

- **3 of 4 women** experience dramatically lighter or no periods
- About 1 in 3 women have no periods at all after the procedure
- Most women return to normal activities within 1–2 days
- No hormones — no hormonal side effects
- Performed in office — no hospital stay needed
- One-time, permanent procedure

**⚠️ NovaSure Is Best For:**

- Premenopausal women with heavy periods due to benign causes
- Women who are **done with childbearing**
- Women who prefer to avoid hysterectomy
- Women who want to avoid long-term hormonal therapy

## 🚫 WHO IS NOT A CANDIDATE?

**🔴 NovaSure Is NOT Appropriate If You:**

- Want to have children in the future (pregnancy after ablation is dangerous)
- Have or suspect uterine cancer or pre-cancer
- Have an active genital, urinary, or pelvic infection
- Have an IUD currently in place
- Have certain uterine abnormalities (large fibroids, uterine septum)
- Have had a prior classical cesarean section or uterine surgery

**⚠️ Birth Control Still Required After NovaSure:**

- Ablation is **NOT a form of birth control**
- Pregnancy can still occur and is extremely high risk
- Discuss sterilization or contraception options with Dr. Klein before or at time of procedure

**⚠️ After the Procedure — Normal to Experience:**

- Cramping and mild nausea for several hours
- Watery or bloody vaginal discharge for up to 4 weeks
- Allow 3 months for menstrual pattern to fully stabilize

### Stop Letting Your Period Control Your Life
